## **A Casino in Wisconsin installs 45kVA and 200kVA Power Centers™ to supply its critical loads**

As an alternative to legacy Power Distribution Units, Type PC **e-Rated®** Power Centers™ provides cost-effective, compact and ultra-efficient power source that can be closely matched to a system designer's specific requirements.

Power Centers™ are available with both Distribution Transformers and Distribution TransFilters™ that assure distribution system and load efficiencies when the loads are nonlinear.

When specified, Power Centers™ are equipped with Type TPM Transformer Performance Meters™ that confirm the transformer's performance and provide a detailed analysis of the Load Factor and its harmonic profile. With an optional module, this information can be recorded and reviewed remotely.

Compact designs conserve valuable floor space. Enclosures with side mounted circuit breakers are identical in size to standard transformer enclosures with the same kVA rating. Enclosures with front mounted circuit breakers are identical in size to standard transformer enclosures with the same kVA rating in width and height,

but extended in depth to accommodate the circuit breakers.

Power Centers™, which are available in all ratings between 15kVA and 1500kVA, are UL Listed and CSA Certified for hassle free inspections and building code approvals.

*45kVA Power Center™  
with Side Mounted Circuit Breakers*

*20kVA Power Center™  
with three Side Mounted Feeder Circuit Breakers*

*200kVA Power Center™  
distributes EMERSON UPS output power to Gaming Machines*
